## LAB 1 - Implementation of toy problems.

**Aim:** Implementation of toy problems

### Problem Statement:

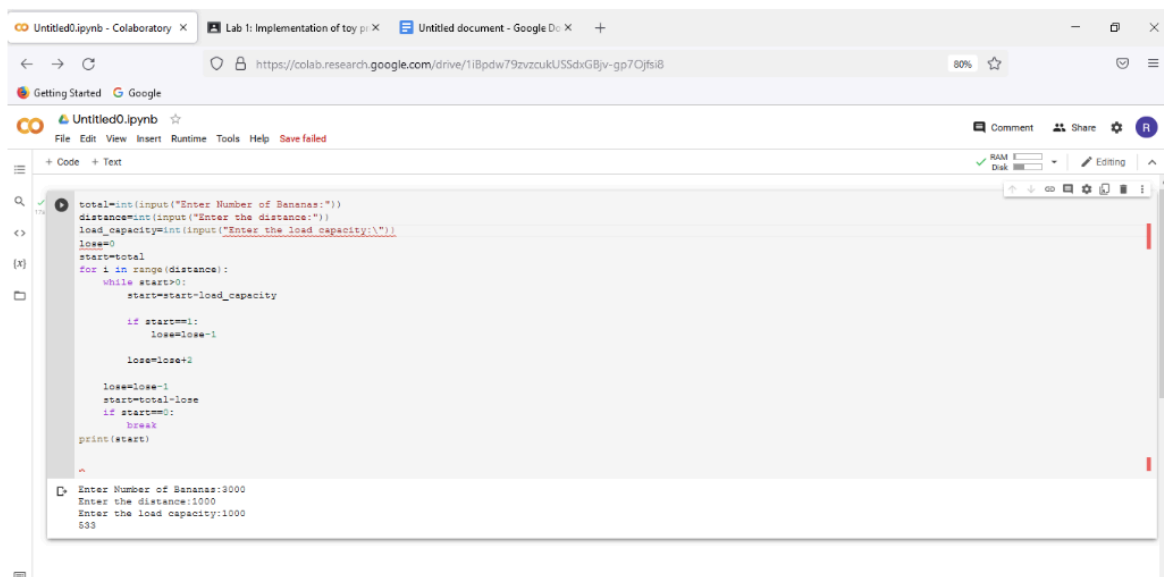

A person has 3000 bananas and a camel. The person wants to transport the maximum number of bananas to a destination which is 1000 KMs away, using only the camel as a mode of transportation. The camel cannot carry more than 1000 bananas at a time and eats a banana every km it travels. What is the maximum number of bananas that can be transferred to the destination using only camel (no other mode of transportation is allowed).

### Code:

```
banana=int(input('Enter the total number of
bananas: ')) dist=int(input('Enter total distance to be
covered: '))
ip1 = banana-
dist ip2 =
banana-ip1
x=(banana-
ip1)/5 y=(ip1-
ip2)/3 z=ip2-x-
y max=ip2-z
print('maximum number of bananas camel can tranfer=',int(max))
```

### Input:

3000  
1000

```
total=int(input("Enter Number of Bananas:"))
distance=int(input("Enter the distance:"))
load_capacity=int(input("Enter the load capacity:"))
loss=0
start=total
for i in range(distance):
    while start>0:
        start=start-load_capacity
        if start==1:
            loss=loss+1
            loss=loss+2
        loss=loss-1
        start=total-loss
        if start==0:
            break
    print(start)
```

Enter Number of Bananas:9000  
Enter the distance:1000  
Enter the load capacity:1000  
533

**Output:**

**Result:** Hence the toy problem was implemented and the desired output was obtained.

## LAB 2 - Developing agent programs for real world problems

**AIM** – Developing agent programs for real world problems by implementing graph coloring problem

### Problem description:

Graph coloring (also called vertex coloring) is a way of coloring a graph's vertices such that no two adjacent vertices share the same color. This post will discuss a greedy algorithm for graph coloring and minimize the total number of colors used.

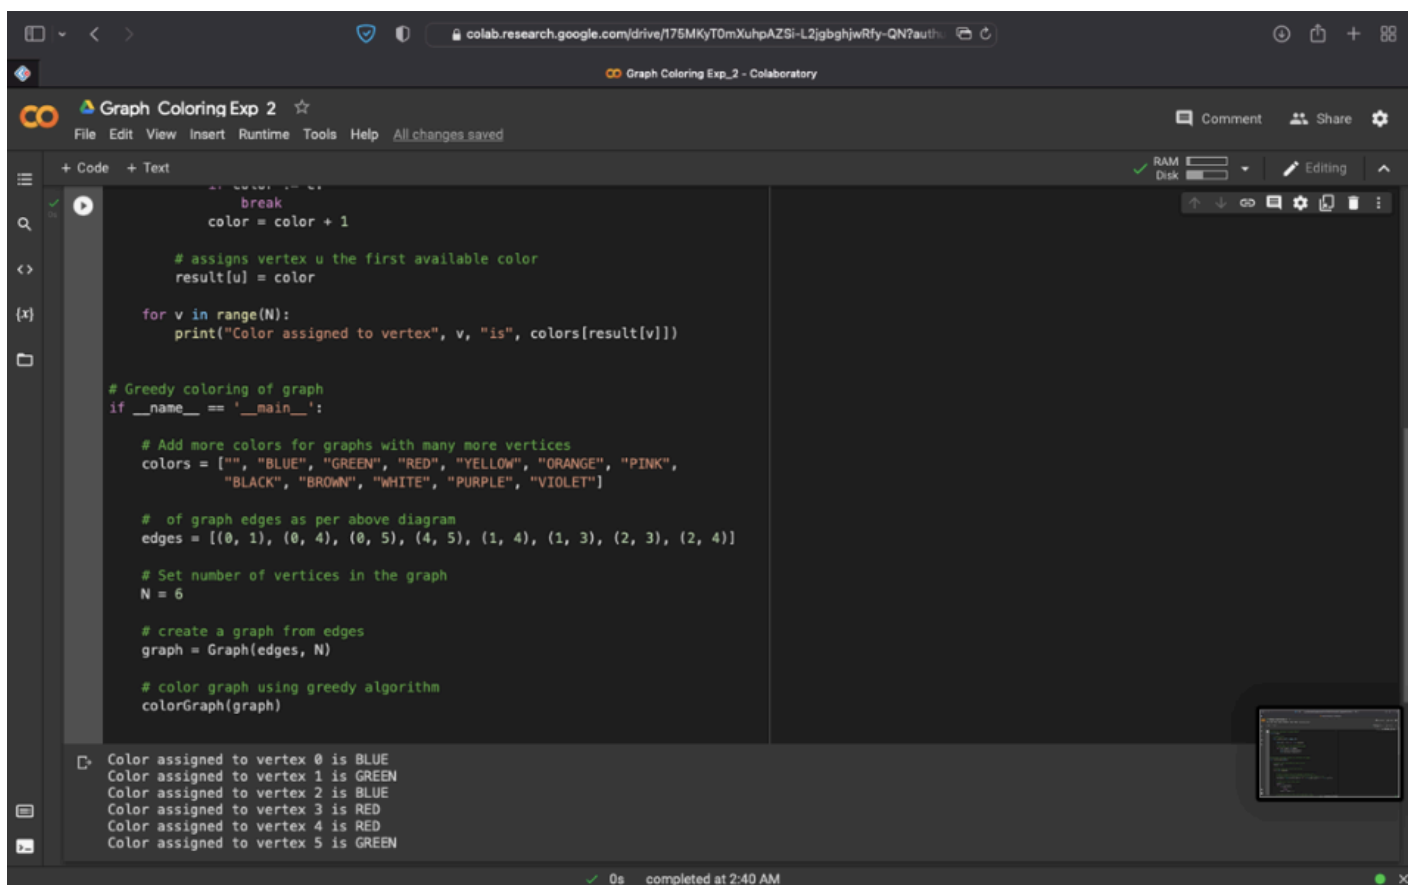

### CODE:

```
class Graph:
    def __init__(self, edges, n):
        self.adjList = [[]]
    for _ in range(n):
        for (src, dest) in edges:
            self.adjList[src].append(dest)
            self.adjList[dest].append(src)
def colorGraph(graph, n):
    result = {}
    for u in range(n):
        assigned = set([result.get(i) for i in graph.adjList[u] if i in result])
        color = 1
        for c in assigned:
            if color != c:
                break
        color = color + 1
        result[u] = color
    for v in range(n):
        print(f'Color assigned to vertex {v} is {colors[result[v]]}')
if __name__ == '__main__':
    colors = [' ', 'BLUE', 'GREEN', 'RED', 'YELLOW', 'ORANGE', 'PINK',
              'BLACK', 'BROWN', 'WHITE', 'PURPLE', 'VOILET']
    edges = [(0, 1), (0, 4), (0, 5), (4, 5), (1, 4), (1, 3), (2, 3), (2, 4)]
    n = 8
    graph = Graph(edges, n)
    colorGraph(graph, n)
```

## OUTPUT:

Color assigned to vertex 0 is BLUE  
Color assigned to vertex 1 is GREEN  
Color assigned to vertex 2 is BLUE  
Color assigned to vertex 3 is RED  
Color assigned to vertex 4 is RED  
Color assigned to vertex 5 is GREEN  
Color assigned to vertex 6 is BLUE  
Color assigned to vertex 7 is BLUE

## SCREENSHOTS:

The screenshot shows a Google Colab notebook interface. The notebook is titled "Graph Coloring Exp 2". The code in the cell is as follows:

```
def color(u):
    for color in colors:
        if not color in result[u]:
            break
    color = color + 1

    # assigns vertex u the first available color
    result[u] = color

for v in range(N):
    print("Color assigned to vertex", v, "is", colors[result[v]])

# Greedy coloring of graph
if __name__ == '__main__':
    # Add more colors for graphs with many more vertices
    colors = ["", "BLUE", "GREEN", "RED", "YELLOW", "ORANGE", "PINK",
              "BLACK", "BROWN", "WHITE", "PURPLE", "VIOLET"]

    # of graph edges as per above diagram
    edges = [(0, 1), (0, 4), (0, 5), (4, 5), (1, 4), (1, 3), (2, 3), (2, 4)]

    # Set number of vertices in the graph
    N = 6

    # create a graph from edges
    graph = Graph(edges, N)

    # color graph using greedy algorithm
    colorGraph(graph)
```

The output of the code is displayed in the bottom left corner of the notebook:

```
Color assigned to vertex 0 is BLUE
Color assigned to vertex 1 is GREEN
Color assigned to vertex 2 is BLUE
Color assigned to vertex 3 is RED
Color assigned to vertex 4 is RED
Color assigned to vertex 5 is GREEN
```

The status bar at the bottom indicates "0s completed at 2:40 AM".

```
Color assigned to vertex 0 is BLUE
Color assigned to vertex 1 is GREEN
Color assigned to vertex 2 is BLUE
Color assigned to vertex 3 is RED
Color assigned to vertex 4 is RED
Color assigned to vertex 5 is GREEN
Color assigned to vertex 6 is BLUE
Color assigned to vertex 7 is BLUE
```

**RESULT:** Hence, Developing agent programs for real world problems was implemented using graph coloring problem.

## LAB 3 - Constrain Satisfaction Problem

**AIM:** To implement Constraint satisfaction problem using python.

### Problem Description:

In a CSP, we have a set of variables with known domains and a set of constraints that impose restrictions on the values those variables can take. Our task is to assign a value to each variable so that we fulfil all the constraints.

So, to formally define a CSP, we specify:

- the set of variables
- the set of their (finite or infinite) domains
- and the set of constraints , where each can involve any number of variables:

### CODE:

```
import itertools
```

```
def get_value(word,
substitution):  s = 0  factor =
1  for letter in
reversed(word):
    s += factor * substitution[letter]
factor *= 10
return s
```

```
def solve2(equation):
    left, right = equation.lower().replace(' ',
''').split('=')  left = left.split('+')  letters =
set(right)  for word in left:  for letter in
word:  letters.add(letter)
    letters = list(letters)
```

```
    digits = range(10)  for perm in
itertools.permutations(digits, len(letters)):
        sol = dict(zip(letters, perm))
```

```
if sum(get_value(word, sol) for word in left) == get_value(right, sol):  
print(' + '.join(str(get_value(word, sol)) for word in left) + " = {}"  
(mapping: {})).format(get_value(right, sol), sol))
```

```
print('SEND + MORE = MONEY ')  
solve2('SEND + MORE = MONEY ')
```

## OUTPUT:

SEND + MORE = MONEY

```
2817 + 368 = 3185 (mapping: {'s': 2, 'n': 1, 'r': 6, 'e': 8, 'o': 3, 'd': 7, 'y': 5, 'm': 0})  
2819 + 368 = 3187 (mapping: {'s': 2, 'n': 1, 'r': 6, 'e': 8, 'o': 3, 'd': 9, 'y': 7, 'm': 0})  
3719 + 457 = 4176 (mapping: {'s': 3, 'n': 1, 'r': 5, 'e': 7, 'o': 4, 'd': 9, 'y': 6, 'm': 0})  
3712 + 467 = 4179 (mapping: {'s': 3, 'n': 1, 'r': 6, 'e': 7, 'o': 4, 'd': 2, 'y': 9, 'm': 0})  
3829 + 458 = 4287 (mapping: {'s': 3, 'n': 2, 'r': 5, 'e': 8, 'o': 4, 'd': 9, 'y': 7, 'm': 0})  
3821 + 468 = 4289 (mapping: {'s': 3, 'n': 2, 'r': 6, 'e': 8, 'o': 4, 'd': 1, 'y': 9, 'm': 0})  
5731 + 647 = 6378 (mapping: {'s': 5, 'n': 3, 'r': 4, 'e': 7, 'o': 6, 'd': 1, 'y': 8, 'm': 0})  
5732 + 647 = 6379 (mapping: {'s': 5, 'n': 3, 'r': 4, 'e': 7, 'o': 6, 'd': 2, 'y': 9, 'm': 0})  
5849 + 638 = 6487 (mapping: {'s': 5, 'n': 4, 'r': 3, 'e': 8, 'o': 6, 'd': 9, 'y': 7, 'm': 0})

8432 + 914 = 9346 (mapping: {'s': 8, 'n': 3, 'r': 1, 'e': 4, 'o': 9, 'd': 2, 'y': 6, 'm': 0})  
8542 + 915 = 9457 (mapping: {'s': 8, 'n': 4, 'r': 1, 'e': 5, 'o': 9, 'd': 2, 'y': 7, 'm': 0})  
9567 + 1085 = 10652 (mapping: {'s': 9, 'n': 6, 'r': 8, 'e': 5, 'o': 0, 'd': 7, 'y': 2, 'm': 1})
```

## SCREENSHOTS:

The screenshot displays the AWS Cloud9 IDE interface. The left sidebar shows a file explorer with a project named 'Dr.R.Radika/Co-'. The main editor window contains a Python script named 'exp3.py'. The script defines a function 'get\_value' that calculates a value for a word based on a substitution mapping. It also defines a function 'solve2' that uses 'itertools.permutations' to find a mapping that satisfies a given equation. The script is run in a terminal window at the bottom, which shows the output of the 'solve2' function for the equation 'EAT + THAT = APPLE'.

```
1 import itertools
2
3 def get_value(word, substitution):
4     s = 0
5     factor = 1
6     for letter in reversed(word):
7         s = factor * substitution[letter]
8         factor *= 10
9     return s
10
11 def solve2(equation):
12     left, right = equation.lower().replace(' ', '').split('=')
13     left = left.split('+')
14     letters = set(right)
15     for word in left:
16         for letter in word:
17             letters.add(letter)
18     letters = list(letters)
19
20     digits = range(10)
21     for perm in itertools.permutations(digits, len(letters)):
22         sol = dict(zip(letters, perm))
23
24         if sum(get_value(word, sol) for word in left) == get_value(right, sol):
25             print(' '.join(str(get_value(word, sol)) for word in left) + " = {} (mapping: {})".format(get_value(right, sol), sol))
26
27 print('EAT + THAT = APPLE ')
28 solve2('POINT + ZERO = ENERGY ')
```

Terminal Output:

```
EAT + THAT = APPLE
71582 + 9861 = 88443 (mapping: {'e': 0, 't': 2, 'a': 1, 'p': 9, 'i': 3, 'r': 6, 'g': 4, 'l': 5, 'n': 8, 'h': 7})
51762 + 9861 = 68443 (mapping: {'e': 0, 't': 2, 'a': 1, 'p': 9, 'i': 3, 'r': 6, 'g': 4, 'l': 5, 'n': 8, 'h': 7})
71385 + 9841 = 88426 (mapping: {'e': 0, 't': 5, 'a': 1, 'p': 9, 'i': 6, 'r': 4, 'g': 2, 'l': 3, 'n': 8, 'h': 7})
```

## Results:

Constraint Satisfaction problem has been successfully implemented.

## LAB 4- Implementation and Analysis of BFS and DFS for an application

**AIM** - Implementation and analysis of BFS and DFS for an application.

### Problem Description of BFS:

Breadth-first search (BFS) is an algorithm for searching a tree data structure for a node that satisfies a given property. It starts at the tree root and explores all nodes at the present depth prior to moving on to the nodes at the next depth level. Extra memory, usually a queue, is needed to keep track of the child nodes that were encountered but not yet explored.

### BFS Breadth First Search Code:

```
graph =
{ '5' :
['3','7'],
  '3' : ['2', '4'],
  '7' : ['8'],
  '2' : [],
  '4' : ['8'],
  '8' : [] } visited = []
queue = []    def
bfs(visited, graph,
node):
visited.append(node)
queue.append(node) while
queue:        m = queue.pop(0)
print (m, end = " ")    for
neighbour in graph[m]:
if neighbour not in visited:
visited.append(neighbour)
queue.append(neighbour)
print("Following is the Breadth-First Search")
bfs(visited, graph, '5')
```

## Screenshot:

```
graph = {
    '5': ['3', '7'],
    '3': ['2', '4'],
    '7': ['8'],
    '2': [],
    '4': ['6'],
    '8': []
}

visited = [] # List for visited nodes.
queue = [] # Initialize a queue

def bfs(visited, graph, node): #function for BFS
    visited.append(node)
    queue.append(node)

    while queue: # Creating loop to visit each node
        m = queue.pop(0)
        print (m, end = " ")

        for neighbour in graph[m]:
            if neighbour not in visited:
                visited.append(neighbour)
                queue.append(neighbour)

# Driver Code
print("Following is the Breadth-First Search")
bfs(visited, graph, '5') # Function calling
```

bash - "p-172-31-10-254" x exp3.py x exp4\_dfs.py x exp4\_bfs.py x

Run Command: RA1911030010094/exp4\_bfs.py Runner: Python 3 CWD: ENW

## Problem Description of DFS:

Depth First Search (DFS) is often used for traversing and searching a tree or graph data structure. The idea is to start at the root (in the case of a tree) or some arbitrary node (in the case of a graph) and explores each branch as far as possible before backtracking.

## DFS – Depth First Search Code:

```
graph = {
    'A': ['B', 'C'],
    'B': ['D'],
    'C': ['F'],
    'D': ['E', 'F'],
    'E': [],
    'F': ['A']
}

visited = set() # Keep track of visited nodes.
```

```
def dfs(visited, graph, node):
    if node not in visited:
```

```

print (node)
visited.add(node)    for
neighbour in graph[node]:
dfs(visited, graph, neighbour)

```

```
dfs(visited, graph, 'A')
```

## Screenshot:

The screenshot shows an AWS Cloud9 IDE interface. The left sidebar displays a file explorer with a project structure including folders like '102\_A1Exp4', '102\_A1Exp3', and 'New Folder.3', and several Python files named 'exp3.py', 'exp4dfs.py', and 'exp4dfs.py'. The main editor window is open to 'exp4dfs.py', which contains the following Python code:

```

1 graph = {
2     'A': ['B', 'C'],
3     'B': ['D'],
4     'C': ['F'],
5     'D': ['E', 'F'],
6     'E': [],
7     'F': ['A']
8 }
9 visited = set() # Keep track of visited nodes.
10
11 def dfs(visited, graph, node):
12     if node not in visited:
13         print (node)
14         visited.add(node)
15         for neighbour in graph[node]:
16             dfs(visited, graph, neighbour)
17
18 dfs(visited, graph, 'A')

```

The bottom status bar indicates the file is 'exp4.py' (18:25 Python Spaces: 4). Below the editor, a terminal window shows the command 'RA1911030010094/exp4.py' being executed, with the output 'Process exited with code: 0'.

The screenshot shows the same AWS Cloud9 IDE interface, but the terminal window now displays the output of a Breadth-First Search (BFS) implementation. The output is as follows:

```

Following is the Breadth-First Search
5 3 7 2 4 8

```

The terminal also shows the command 'RA1911030010094/exp4\_bfs.py' being executed, with the output 'Process exited with code: 0'.

**RESULT:** Hence, BFS and DFS was implemented and analysed for an application.

## LAB 5 – Developing Best First Search and A\* Algorithm for real world problem

**AIM:** Implementation of Best First Search for an application

### Problem Description for BFS:

Best first search is a traversal technique that decides which node is to be visited next by checking which node is the most promising one and then check it For this it uses an evaluation function to decide the traversal. This best first search technique of tree traversal comes under the category of heuristic search or informed search technique.

### CODE:

```
from queue import PriorityQueue
v = 14
graph = [[] for i in range(v)]

def best_first_search(source, target, n):
    visited = [0] * n
    visited[0] = True    pq =
    PriorityQueue()
    pq.put((0, source))
    while pq.empty() ==
    False:
        u = pq.get()[1]
        print(u, end=" ")
        if u == target:
            break

        for v, c in graph[u]:
            if visited[v] == False:
                visited[v] = True
                pq.put((c, v))    print()

def addedge(x, y, cost):
    graph[x].append((y, cost))
    graph[y].append((x, cost))

adddedge(0, 1, 3)
adddedge(0, 2, 6)
adddedge(0, 3, 5)
```

```

addedge(1, 4, 9)
addedge(1, 5, 8)
addedge(2, 6, 12)
addedge(2, 7, 14)
addedge(3, 8, 7)
addedge(8, 9, 5)
addedge(8, 10, 6)
addedge(9, 11, 1)
addedge(9, 12, 10)
addedge(9, 13, 2)

```

```

source = 0
target = 9
best_first_search(source, target, v)

```

## OUTPUT

0 1 3 2 8 9

## SCREENSHOT:

```

1 from queue import PriorityQueue
2 v = 14

```

### A\* algorithm:

- open set is list of nodes which have been visited but neighbors haven't all been inspected whereas closed set is list of nodes which have been visited but neighbors have been inspected.
- g contains current distances from start node to all other nodes.
- parents contains adjacency map of all nodes
- we find a node with the lowest value of  $f()$  - evaluation function
- if the current node is the stop\_node then we begin reconstructing the path from it to the start\_node
- if the current node isn't in both open set and closed set add it to open set and note n as its parent
- otherwise, check if it's quicker to first visit n, then m and if it is, update parent data and g data and if the node was in the closed set, move it to open set
- remove n from the open set, and add it to closed set because all of his neighbors were inspected

### GRAPH:

### CODE:

```
def aStarAlgo(start_node, stop_node):
    open_set = set(start_node)
    closed_set = set()
    g = {}
    parents = {}
    g[start_node] = 0
    parents[start_node] = start_node

}
aStarAlgo('A', 'G')

```

## OUTPUT:

The screenshot shows a Jupyter Notebook interface with a dark theme. The main editor displays a Python script for an A\* search algorithm. The script defines a heuristic function, a graph, and an A\* search function. The output of the script is shown in the bottom panel, indicating the path found is ['A', 'E', 'D', 'G'] and the process exited with code 0.

```

exp_5.py
87 #and this function returns heuristic distance for all nodes
88 def heuristic(n):
89     H_dist = {
90         'A': 11,
91         'B': 6,
92         'C': 99,
93         'D': 1,
94         'E': 7,
95         'G': 0,
96     }
97
98     return H_dist[n]
99
100
101 #Describe your graph here
102 Graph_nodes = {
103     'A': [('B', 2), ('E', 3)],
104     'B': [('C', 1), ('G', 9)],
105     'C': None,
106     'E': [('D', 6)],
107     'D': [('G', 1)],
108 }
109
110 aStarAlgo('A', 'G')

```

Path found: ['A', 'E', 'D', 'G']

Process exited with code: 0

**Result:** Therefore, BFS and A\* algorithm has been implemented successfully

## LAB 6 - Minimax algorithm for an application

**AIM:** Implementation of minimax algorithm for Tic Tac Toe.

### Problem Description:

- If the game is over, return the score from X's perspective.
- Otherwise get a list of new game states for every possible move
- Create a scores list
- For each of these states add the minimax result of that state to the scores list
- If it's X's turn, return the maximum score from the scores list
- If it's O's turn, return the minimum score from the scores list

### CODE:

```
theBoard = {'1': ' ', '2': ' ', '3': ' ',
            '4': ' ', '5': ' ', '6': ' ',

**RESULT:** Hence, Minimax algorithm was implemented for Tic Tac Toe problem.

## Exp7 -Unification and Resolution.

**AIM:** To implement unification and resolution algorithm.

### PROCEDURE for Unification:

- 1) Initialize the substitution set to be empty.
- 2) Recursively unify atomic sentences:
  - Check for Identical expression match.
  - If one expression is a variable  $v_i$ , and the other is a term  $t_i$  which does not contain variable  $v_i$ , then:
    - Substitute  $t_i / v_i$  in the existing substitutions
    - Add  $t_i / v_i$  to the substitution setlist.
  - If both the expressions are functions, then function name must be similar, and the number of arguments must be the same in both the expression.

For each pair of the following atomic sentences find the most general unifier (If exist).

### CODE:

```
def get_index_comma(string):
    index_list = list()
    par_count = 0

    for i in range(len(string)):
        if string[i] == ',' and par_count == 0:

            index_list.append(i)
        elif string[i] == '(':
            par_count += 1
        elif string[i] == ')':
            par_count -= 1

    return index_list

    print(result)

```

## SCREENSHOT:

--

## PROCEDURE for Resolution:

Resolution is used, if there are various statements are given, and we need to prove a conclusion of those statements. Unification is a key concept in proofs by resolutions. Resolution is a single inference rule which can efficiently operate on the conjunctive normal form or clausal form.

- 1) Conversion of facts into first-order logic.
- 2) Convert FOL statements into CNF
- 3) Negate the statement which needs to prove (proof by contradiction)
- 4) 4) Draw resolution graph (unification).

## LAB 8 - Implementation of knowledge representation schemes - use cases

**AIM:** To implement knowledge representation schemes.

### ALGORITHM:

- Create a knowledge base with identification rules.
- Create a question-and-answer knowledge.
- Ask question to user
- Use the inputs to the database
- If an animal is found print the guess.

### CODE:

```
/* animal.pl animal
identification game.

    start with ?- go.    */ go :-
hypothesize(Animal),    write('I
guess that the animal is: '),
write(Animal),
    nl,
undo.

/* hypotheses to be tested */
hypothesize(cheetah) :- cheetah, !.
hypothesize(tiger)   :- tiger, !.
hypothesize(giraffe) :- giraffe, !.
hypothesize(zebra)   :- zebra, !.
hypothesize(ostrich) :- ostrich, !.
hypothesize(penguin) :- penguin, !.
hypothesize(albatross) :- albatross, !.
hypothesize(unknown).    /* no diagnosis */

/* animal identification rules */
cheetah :- mammal,
        carnivore,
```

```
        verify(has_tawny_color),
verify(has_dark_spots).
tiger :- mammal,
carnivore,
        verify(has_tawny_color),
verify(has_black_stripes). giraffe

Does the animal have the following attribute: flies_well? |: yes.
I guess that the animal is: albatross
true.
?-
```

**RESULT:** Hence, knowledge representation schemes was implemented.

## LAB 9 - Implementation of uncertain methods for an application

**AIM:** To implement uncertain methods for Monty Hall problem.

### Problem Statement:

The Monty Hall problem is a counter-intuitive statistics puzzle:

- There are 3 doors, behind which are two goats and a car.
- You pick a door (call it door A). You're hoping for the car of course.
- Monty Hall, the game show host, examines the other doors (B & C) and opens one with a goat. (If both doors have goats, he picks randomly.)

### CODE:

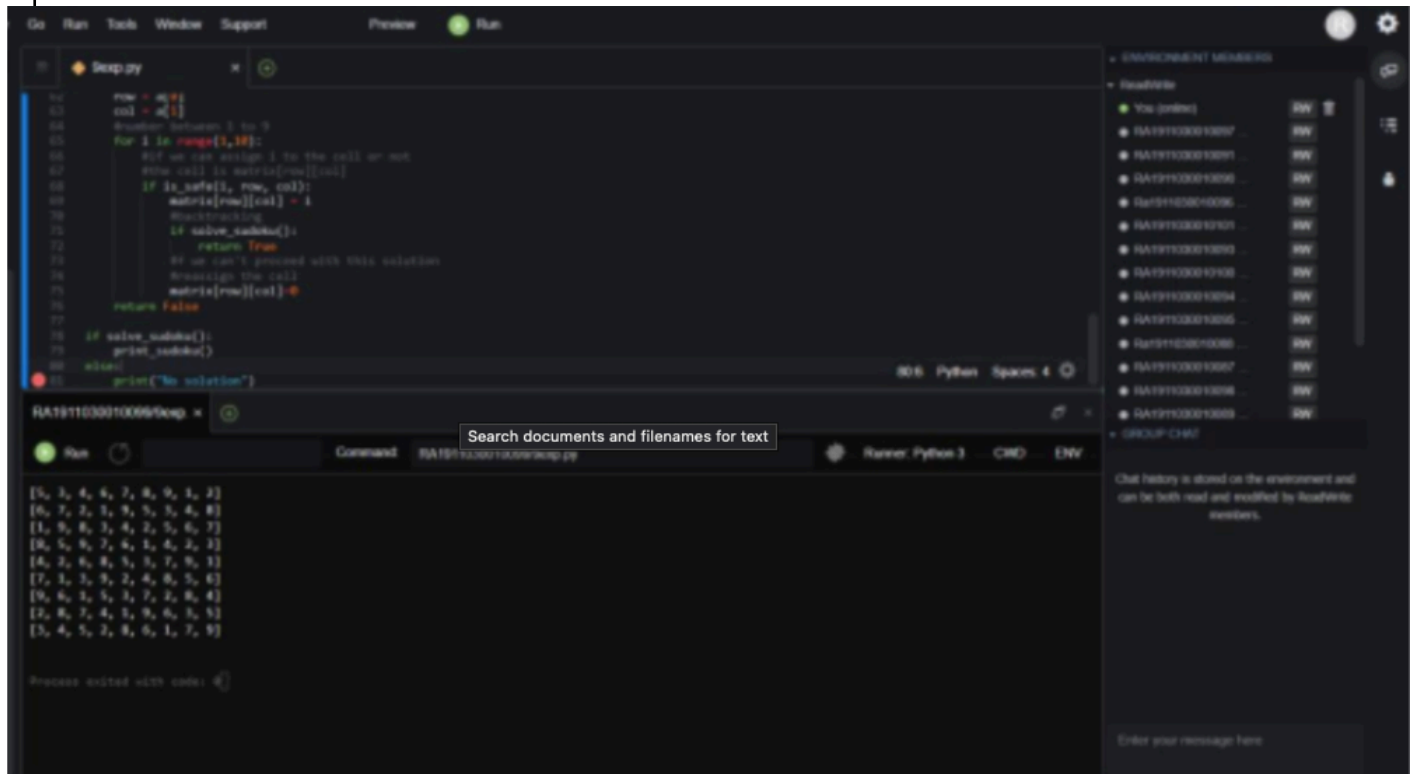

```
import matplotlib.pyplot as plt
import seaborn; seaborn.set_style('whitegrid')
import numpy from
pomegranate import *
numpy.random.seed(0)
numpy.set_printoptions(suppress=True)
guest = DiscreteDistribution({'A': 1./3, 'B': 1./3, 'C': 1./3})
prize = DiscreteDistribution({'A': 1./3, 'B': 1./3, 'C': 1./3})
monty = ConditionalProbabilityTable(
    [[ 'A', 'A', 'A', 0.0 ],
     [ 'A', 'A', 'B', 0.5
    ],     [ 'A', 'A', 'C',
0.5 ],     [ 'A', 'B',
'A', 0.0 ],
     [ 'A', 'B', 'B', 0.0
    ],     [ 'A', 'B', 'C',
1.0 ],
     [ 'A', 'C', 'A', 0.0 ],
     [ 'A', 'C', 'B', 1.0
    ],     [ 'A', 'C', 'C',
0.0 ],
     [ 'B', 'A', 'A', 0.0 ],
     [ 'B', 'A', 'B', 0.0
    ],     [ 'B', 'A', 'C',
1.0 ],     [ 'B', 'B',
'A', 0.5 ],
```

```

        [ 'B', 'B', 'B', 0.0
],      [ 'B', 'B', 'C',
0.5 ],
        [ 'B', 'C', 'A', 1.0 ],
        [ 'B', 'C', 'B', 0.0
],      [ 'B', 'C', 'C',
0.0 ],
        [ 'C', 'A', 'A', 0.0 ],
        [ 'C', 'A', 'B', 1.0
],      [ 'C', 'A', 'C',
0.0 ],      [ 'C', 'B',
'A', 1.0 ],
        [ 'C', 'B', 'B', 0.0
],      [ 'C', 'B', 'C',
0.0 ],
        [ 'C', 'C', 'A', 0.5 ],
        [ 'C', 'C', 'B', 0.5 ],
        [ 'C', 'C', 'C', 0.0 ]], [guest,
prize]) s1 = State(guest,
name="guest") s2 = State(prize,
name="prize")
s3 = State(monty, name="monty")
# Create the Bayesian network object with a useful name
model = BayesianNetwork("Monty Hall Problem")
model.add_states(s1, s2, s3)
model.add_edge(s1, s3)
model.add_edge(s2, s3)
model.bake()
model.probability([[ 'A', 'B', 'C' ]])
model.probability([[ 'A', 'B', 'C' ]])
print(model.predict_proba({}))
print(model.predict_proba([None, None, None]))
print(model.predict_proba([ 'A', None, None ]))
print(model.predict_proba([{'guest': 'A', 'monty': 'B'}]))

```

## SCREENSHOTS

The screenshot displays a Jupyter Notebook environment with a dark theme. The main area shows a Python script named 'Sudoku.py' with the following code:

```
12 row = a[i]
13 col = a[i]
14 #number between 1 to 9
15 for i in range(1,10):
16     #if we can assign i to the cell or not
17     row_col is matrix[row][col]
18     if is_safe(i, row, col):
19         matrix[row][col] = i
20         #backtracking
21         if solve_sudoku():
22             return True
23         #if we can't proceed with this solution
24         #reassign the cell
25         matrix[row][col] = 0
26     return False
27
28 if solve_sudoku():
29     print_sudoku()
30 else:
31     print("No solution")
```

The output of the script is a 9x9 grid of numbers, representing a solved Sudoku puzzle:

```
[5, 3, 4, 6, 7, 8, 9, 1, 2]
[6, 7, 2, 1, 9, 5, 3, 4, 8]
[1, 9, 8, 3, 4, 2, 5, 6, 7]
[8, 5, 9, 7, 4, 1, 4, 2, 3]
[4, 2, 6, 8, 5, 3, 7, 9, 1]
[7, 1, 3, 9, 2, 4, 6, 5, 8]
[9, 6, 1, 5, 3, 7, 2, 8, 4]
[2, 8, 7, 4, 1, 9, 6, 5, 3]
[3, 4, 5, 2, 8, 6, 1, 7, 9]
```

Below the output, it says "Process exited with code: 0".

On the right side, there is a sidebar with "ENVIRONMENT MEMBERS" and a list of users, including "You (online)" and several other users with "RW" permissions. At the bottom right, there is a "GROUP CHAT" section with a message input field.

**RESULT:** Hence, the uncertain method for an application was implemented.

## LAB 10 -Implementation of Block world Problem

**AIM:** To implement block world problem.

### Problem Statement:

The blocks world is a planning domain in artificial intelligence. The algorithm is similar to a set of wooden blocks of various shapes and colors sitting on a table. The goal is to build one or more vertical stacks of blocks. Only one block may be moved at a time: it may either be placed on the table or placed atop another block. Because of this, any blocks that are, at a given time, under another block cannot be moved. Moreover, some kinds of blocks cannot have other blocks stacked on top of them

### CODE:

```
class PREDICATE:
    def __str__(self):
        pass
    def __repr__(self):
        pass

## RESULT:

Hence, Block world problem was implemented.

## Lab 11 - Implementation of learning algorithms for an application

### Aim:

- A) Implementation of a Linear Regression algorithm to predict student's scores using the given dataset.
- B) Implementation of Support Vector Classification algorithm to classify the cases of breast cancer using the given dataset.
- C) Implementation of K-means clustering algorithm to group the customers based on their demographic detail using the given dataset.

### A: Linear Regression on Student's Score

#### Code:

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LinearRegression
from sklearn import metrics
%matplotlib inline
```

```
dataset = pd.read_csv('student_scores.csv')
dataset.head()
```

	Hours	Scores
0	2.5	21
1	5.1	47
2	3.2	27
3	8.5	75
4	3.5	30

```
dataset.describe()
```

	Hours	Scores
count	25.000000	25.000000
mean	5.012000	51.480000
std	2.525094	25.286887
min	1.100000	17.000000
25%	2.700000	30.000000
50%	4.800000	47.000000
75%	7.400000	75.000000
max	9.200000	95.000000

```
dataset.plot(x='Hours', y='Scores', style='o') plt.title('Hours vs Percentage')
plt.xlabel('Hours Studied')
plt.ylabel('Percentage Score')
plt.show()
```

```
X = dataset.iloc[:, :-1].values
y = dataset.iloc[:, 1].values
X_train, X_test, Y_train, Y_test = train_test_split(X, y, test_size=0.2, random_state=0)
print('X train shape: ', X_train.shape)
print('Y train shape: ', Y_train.shape)
print('X test shape: ', X_test.shape)
print('Y test shape: ', Y_test.shape)
```

```
regressor = LinearRegression()
regressor.fit(X_train, y_train)
print(regressor.intercept_)
print(regressor.coef_)
```

```
df = pd.DataFrame({'Actual': y_test, 'Predicted': y_pred}) print(df)
```

```

Actual Predicted
0      20  16.884145
1      27  33.732261
2      69  75.357018
3      30  26.794801
4      62  60.491033
```

```
print('Mean Absolute Error:', metrics.mean_absolute_error(y_test, y_pred)) print('Mean Squared Error:', metrics.mean_squared_error(y_test, y_pred)) print('Root Mean Squared Error:', np.sqrt(metrics.mean_squared_error(y_test, y_pred)))
```

```

Mean Absolute Error: 4.183859899002982
Mean Squared Error: 21.598769307217456
Root Mean Squared Error: 4.647447612100373
```

## B: Support Vector Classification algorithm to classify the cases of breast cancer

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
from sklearn.svm import SVC
```

```
%matplotlib inline
```

```
from sklearn.datasets import load_breast_cancer
```

```
cancer = load_breast_cancer()
```

```
df_cancer = pd.DataFrame(np.c_[cancer['data'], cancer['target']], columns =
np.append(cancer['feature_names'], ['target']))
```

```
df_cancer.head()
```

mtp.ylabel('Spending Score (1-100)')
mtp.legend()
mtp.show()

```

**Result:** Hence, we successfully implemented Linear Regression, SVM and K-means, verified the output, and documented the result.

## Lab 12 - Development Of Ensemble Model

**Aim:** To develop a model an ensemble model for an application.

### Theory:

Ensemble learning helps improve machine learning results by combining several models. This approach allows the production of better predictive performance compared to a single model. Basic idea is to learn a set of classifiers (experts) and to allow them to vote.

### Code:

#### Bagged decision trees:

```
import pandas
from sklearn import model_selection
from sklearn.ensemble import BaggingClassifier
from sklearn.tree import DecisionTreeClassifier

url = "https://raw.githubusercontent.com/jbrownlee/Datasets/master/pima-indians-diabetes.data.csv"

names = ['preg', 'plas', 'pres', 'skin', 'test', 'mass', 'pedi', 'age', 'class']
dataframe = pandas.read_csv(url, names=names)
array = dataframe.values
X = array[:,0:8]
Y = array[:,8]
seed = 7

kfold = model_selection.KFold(n_splits=10, random_state=seed, shuffle=True)
cart = DecisionTreeClassifier()
num_trees = 100
model = BaggingClassifier(base_estimator=cart, n_estimators=num_trees, random_state=seed)
results = model_selection.cross_val_score(model, X, Y, cv=kfold)

print(results)
print(results.mean())
```

### Random Forest:

```
import pandas
from sklearn import model_selection
from sklearn.ensemble import RandomForestClassifier

url = "https://raw.githubusercontent.com/jbrownlee/Datasets/master/pima-indians-diabetes.data.csv"

names = ['preg', 'plas', 'pres', 'skin', 'test', 'mass', 'pedi', 'age', 'class']
dataframe = pandas.read_csv(url, names=names)
array = dataframe.values
X = array[:,0:8]
Y = array[:,8]
seed = 7
num_trees = 100
max_features = 3
kfold = model_selection.KFold(n_splits=10, random_state=seed, shuffle=True)
model = RandomForestClassifier(n_estimators=num_trees, max_features=max_features)
results1 = model_selection.cross_val_score(model, X, Y, cv=kfold)
print(results1)
print(results1.mean())
```

### Extra trees:

```
import pandas
from sklearn import model_selection
from sklearn.ensemble import ExtraTreesClassifier

url = "https://raw.githubusercontent.com/jbrownlee/Datasets/master/pima-indians-diabetes.data.csv"

names = ['preg', 'plas', 'pres', 'skin', 'test', 'mass', 'pedi', 'age', 'class']
dataframe = pandas.read_csv(url, names=names)

array = dataframe.values
X = array[:,0:8]
```

```
Y = array[:,8]
```

```
seed = 7
```

```
num_trees = 100
```

```
max_features = 7
```

```
kfold = model_selection.KFold(n_splits=10, random_state=seed, shuffle=True)
```

```
model = ExtraTreesClassifier(n_estimators=num_trees, max_features=max_features)
```

```
results2 = model_selection.cross_val_score(model, X, Y, cv=kfold)
```

```
print(results2)
```

```
print(results2.mean())
```

## Output:

### Bagged decision trees:

```
[8] model = BaggingClassifier(base_estimator=cart, n_estimators=num_trees, random_state=seed)
      results = model_selection.cross_val_score(model, X, Y, cv=kfold)
      print(results)

[0.76623377 0.75324675 0.74025974 0.77922078 0.80519481 0.79220779
 0.66233766 0.75324675 0.78947368 0.73684211]
```

```
print(results.mean())

0.7578263841421736
```

### Random Forest:

```
print(results1)
print(results1.mean())

[0.79220779 0.79220779 0.7012987  0.80519481 0.79220779 0.80519481
 0.67532468 0.80519481 0.82894737 0.75      ]
0.7747778537252221
```

### Extra trees:

```
print(results2)
print(results2.mean())

[0.79220779 0.80519481 0.68831169 0.79220779 0.77922078 0.76623377
 0.67532468 0.79220779 0.76315789 0.75      ]
0.7604066985645933
```

**RESULT:** Hence, successfully implemented the problem and verified the output and document result.

## Lab 13 - Implementation of NLP problem

**Aim:** To Implement NLP programs.

### Theory:

NLP stands for Natural Language Processing, which is a part of Computer Science, Human language, and Artificial Intelligence. It is the technology that is used by machines to understand, analyse, manipulate, and interpret human's languages. It helps developers to organize knowledge for performing tasks such as translation, automatic summarization, Named Entity Recognition (NER), speech recognition, relationship extraction, and topic segmentation.

### Code:

```
import pandas as pd
import sqlite3
import regex as re
import matplotlib.pyplot as plt

from wordcloud import WordCloud

df = pd.read_csv('emails.csv')
df.head()

print("spam count: " +str(len(df.loc[df.spam==1])))
print("not spam count: " +str(len(df.loc[df.spam==0])))
print(df.shape)
df['spam'] = df['spam'].astype(int)

df = df.drop_duplicates()
print(df.shape)

df = df.reset_index(inplace = False)[['text','spam']]
```

```
print(df.shape)
df['spam'].unique()
df.head()
```

```
clean_desc = []
for w in range(len(df.text)):
    desc = df['text'][w].lower()

    #remove punctuation
    desc = re.sub('[^a-zA-Z]', ' ', desc)

    #remove tags
    desc=re.sub("</?.*?>"," <&gt; ",desc)

    #remove digits and special chars
    desc=re.sub("(\\d|\\W)+"," ",desc)

    clean_desc.append(desc)
```

```
#assign the cleaned descriptions to the data frame
df['text'] = clean_desc
df = df.reset_index()
df.head(3)
```

```
df1 =df.loc[df.spam==0]
df2 =df.loc[df.spam==1]
stop_words = ['is','you','your','and', 'the', 'to', 'from', 'or', 'I', 'for', 'do', 'get', 'not', 'here', 'in', 'im', 'have',
'on', 're', 'new', 'subject']
#set the word cloud parameters
wordcloud = WordCloud(width = 800, height = 800, background_color = 'black', stopwords =
stop_words, max_words = 1000
                    , min_font_size = 20).generate(str(df['text']))
#plot the word cloud
fig = plt.figure(figsize = (8,8), facecolor = None)
plt.imshow(wordcloud)
plt.axis('off')
plt.show()
```

```
wordcloud = WordCloud(width = 800, height = 800, background_color = 'black', stopwords =
stop_words, max_words = 1000
                    , min_font_size = 20).generate(str(df2['text']))

**RESULT:** Thus, successfully implemented NLP problem.

## Lab 14 - Applying Deep Learning methods to solve real world problems

**Aim:** Applying Deep Learning methods to solve real world problem.

### Theory:

- Deep learning is a type of machine learning and artificial intelligence (AI) that imitates the way humans gain certain types of knowledge.
- Deep learning is an important element of data science, which includes statistics and predictive modelling. It is extremely beneficial to data scientists who are tasked with collecting, analysing and interpreting large amounts of data; deep learning makes this process faster and easier.
- Deep Neural Networks (DNNs) are such types of networks where each layer can perform complex operations such as representation and abstraction that make sense of images, sound, and text.

### Code:

```
# TensorFlow and tf.keras
import tensorflow as tf
from tensorflow import keras

# Helper libraries
import numpy as np
import matplotlib.pyplot as plt
```

```
fashion_mnist = keras.datasets.fashion_mnist
(train_images, train_labels), (test_images, test_labels) = fashion_mnist.load_data()
