REMOTE COMMAND EXECUTION USING UDP

Submitted by- Rahul Goel

Register number- RA1911030010094

GIVEN REQUIREMENTS:

There are two hosts, Client and Server. The Client sends a command to the Server, which executes the command and sends the result back to the Client.

TECHNICAL OBJECTIVE:

Remote Command execution is implemented through this program using which Client is able to execute commands at the Server. Here, the Client sends the command to the Server for remote execution. The Server executes the command and the send result of the execution back to the Client.

METHODOLOGY: Server:

- Include the necessary header files.
- Create a socket using socket function with family AF_INET, type as SOCK DGRAM.
- Initialize server address to 0 using the bzero function.
- Assign the sin_family to AF_INET, sin_addr to INADDR_ANY, sin_port to dynamically assigned port number.
- > Bind the local host using the bind() system call.
- Within an infinite loop, receive the command to be executed from the client.
- > Append text "> temp.txt" to the command.

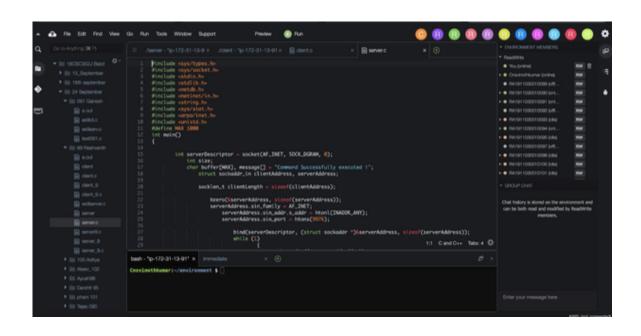

- Execute the command using the "system()" system call.
- Send the result of execution to the Client using a file buffer.
 Client:
- Include the necessary header files.
- Create a socket using socket function with family AF_INET, type as SOCK DGRAM.
- Initialize server address to 0 using the bzero function.
- Assign the sin family to AF INET.
- Get the server IP address and the Port number from the console.
- Using gethostbyname() function assign it to a hostent structure, and assign it to sin_addr of the server address structure.
- Dobtain the command to be executed in the server from the user.
- Send the command to the server.
- Receive the output from the server and print it on the console.

CODING: Server: server.c

```
#include <sys/types.h> #include <sys/socket.h> #include <stdio.h> #include <stdio.h> #include <stdio.h> #include <string.h> #include <sys/stat.h> #include <arpa/inet.h> #include <unistd.h> #define MAX 1000
```

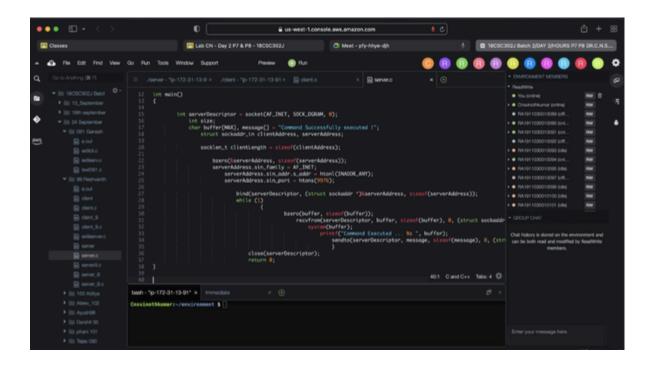

```
int main() {
int serverDescriptor = socket(AF_INET, SOCK_DGRAM, 0);
int size;
```

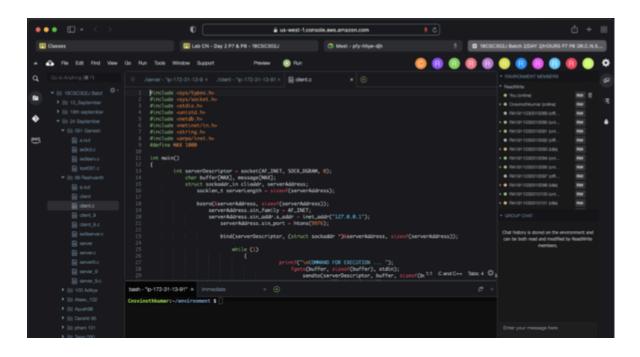

```
char buffer[MAX], message[] = "Command Successfully executed!";
struct sockaddr in clientAddress, serverAddress;
socklen t clientLength = sizeof(clientAddress);
bzero(&serverAddress, sizeof(serverAddress));
serverAddress.sin family = AF INET;
serverAddress.sin addr.s ad dr = htonl(INADDR ANY);
serverAddress.sin port = htons(9976);
bind(serverDescriptor, (struct sockaddr *)&serverAddress,
sizeof(serverAddress));
while (1) {
bzero(buffer, sizeof(buffer));
recvfrom(serverDescriptor, buffer, sizeof(buffer), 0,
(struct sockaddr *)&clientAddress, &clientLength);
system(buffer);
printf("Command Executed ... %s ", buffer);
sendto(serverDescriptor, message, sizeof(message), 0, (struct sockaddr
*)&clientAddress, clientLength);
} close(serverDescriptor); return 0;
```

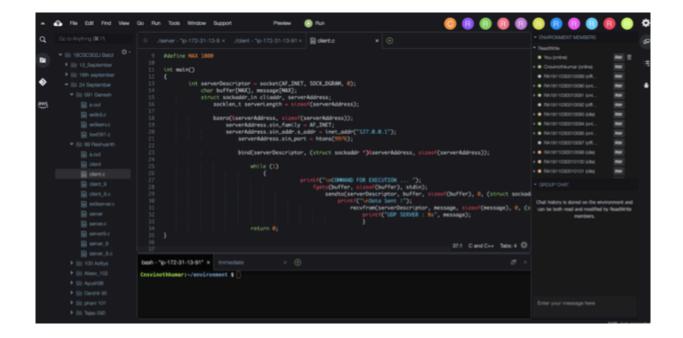

Client:

```
#include <sys/types.h> #include <sys/socket.h> #include <stdio.h> #include
<unistd.h> #include <netdb.h> #include <netinet/in.h> #include <string.h>
#include <arpa/inet.h> #define MAX 1000
int main() {
int serverDescriptor = socket(AF INET, SOCK DGRAM, 0);
char buffer[MAX], message[MAX];
struct sockaddr in cliaddr, serverAddress;
socklen t serverLength = sizeof(serverAddress);
bzero(&serverAddress, sizeof(serverAddress));
serverAddress.sin fami
ly = AF INET;
serverAddress.sin addr .s addr = inet addr("127.0.0.1");
serverAddress.sin port = htons(9976);
bind(serverDescriptor, (struct sockaddr *)&serverAddress,
sizeof(serverAddress));
while (1) {
printf("\nCOMMAND FOR EXECUTION ... ");
fgets(buffer, sizeof(buffer), stdin);
sendto(serverDescripto r, buffer, sizeof(buffer), 0, (struct sockaddr
*)&serverAddress, serverLength);
printf("\nData Sent !");
recvfrom(serverDescri ptor, message, sizeof(message), 0, (struct sockaddr
*)&serverAddress, &serverLength);
printf("UDP SERVER: %s",
message); }
return 0; }
```
